

Prisoner survey methodology

A survey of prisoners is carried out at the start of every scrutiny visit, the results of which contribute to the evidence base for the visit.

HMI Prisons researchers developed a short self-completion questionnaire in June 2020 to support the scrutiny visit methodology. The questionnaire consists of structured questions covering key issues relating to the prisoner experience during the outbreak of COVID-19, together with demographic and background questions which enable us to compare responses from different sub-groups of the prisoner population. There is also an open question at the end of the questionnaire which allows prisoners to expand on any of their responses. All written comments are typed up and provided to the inspection team.

Sampling

On the day of the survey a random sample is drawn by HMI Prisons researchers from a P-NOMIS prisoner population printout ordered by cell location. Using a power calculation, HMI Prisons researchers calculate the minimum sample size required to ensure that the survey findings are representative of the entire population of the establishment. The formula comprising the calculation assumes a 75% response rate (65% in open establishments) and a 95% confidence interval with a 7% margin of error.

Distributing and collecting questionnaires

HMI Prisons researchers distributed and collected the questionnaires in person. A cover sheet was included with the questionnaire which explained the purpose of the survey and that participation was voluntary. Assurances were given about confidentiality, anonymity and the storage and retention of the data. Prisoners were provided with a sealable envelope for their completed questionnaire and told when researchers would return to collect it. Due to social distancing measures researchers were not able to obtain verbal consent from prisoners and therefore returned and completed questionnaires were deemed as providing consent. It was also not possible to facilitate participation in the survey for those who required the survey in a language other than English, or to conduct interviews with prisoners who have literacy problems or visual impairments.

Survey response

At the time of the survey on 8 December 2020 the prisoner population at HMP Leicester was 297. Using the sampling method described above, questionnaires were distributed to 149 prisoners. We received a total of 116 completed questionnaires, a response rate of 78%.

Prisoner survey results and analyses

Over the following pages we present the full survey results followed by numerous comparative analyses for HMP Leicester. For the comparator analyses, where relevant, each question was reformulated using the Chi-square test (or Fisher's exact test if there are fewer than five expected counts in a cell) into a binary 'yes/no' format and affirmative responses compared. Missing responses have been excluded from all analyses and for some questions, responses from a sub-group of the sample are reported (as indicated in the data).

Full survey results

A full breakdown of responses is provided for every question. Percentages have been rounded and therefore may not add up to 100%.

Summary statistics for HMP Leicester 2020

- a percentage for the affirmative response for each question is provided.

Comparisons between different residential locations within HMP Leicester 2020

- responses of prisoners on the Welford unit (Vulnerable Prisoners) compared with those from the rest of the establishment.
- responses of prisoners on the Parson's unit (Enhanced and workers unit) compared with those from the rest of the establishment.
- responses of prisoners on the RCUs (L3 RCU and L4 RCU) compared with those from the rest of the establishment.

Comparisons between self-reported sub-populations of prisoners within HMP Leicester 2020

- responses of prisoners aged 25 and under compared with those over 25.
- responses of prisoners aged 50 and over compared with those under 50.
- responses of prisoners in self-identified racial minority groups are compared with those of white prisoners.
- responses of foreign national prisoners are compared with those of UK/British national prisoners.
- responses of prisoners who reported that they had mental health problems compared with those who did not.
- responses of prisoners who reported that they had a disability compared to those who did not.

Please note that we only carry out within-prison comparator analysis where there is a minimum of 10 responses in each comparison group.

In the comparator analyses, statistically significant differences are indicated by shading. The probability threshold (i.e., p-value) is set at 0.01 which means that there is a 1% likelihood the statistically significant difference between the two groups is due to chance. Results that are significantly more positive are indicated by green shading and results that are significantly more negative are indicated by blue shading. Orange shading has been used to show a statistically significant difference in demographic or other background details. If there is no shading, any difference between the two results is not statistically significant and may have occurred by chance. Grey shading indicates that there is no valid comparative data for that question.
